Exclusions

- Run `dev-20261028-baseline-a`: 1 warm-up episode(s) excluded from every aggregate (outside any cell, design §14.3).
- Run `dev-20261028-chimera`: 1 warm-up episode(s) excluded from every aggregate (outside any cell, design §14.3).

Limitations

(Evaluation.md §6.1 cites “§7 of this document”; the limitations paragraph lives in §8 at this revision and is reproduced verbatim below.)

1. **Scale.** One workflow, one target, four fault scenarios, three input

variations. Roughly 10–30 episodes per run at the default trial count —

far below SRS §11.2's 100-episode minimum for a meaningful zero-rate

claim.

2. **Fault taxonomy width.** Two parameters. The evaluation split varies

values, not types. No unseen-fault generalisation can be assessed.

3. **Verifier risk.** The independent verifier is itself a component that

can be wrong, in both directions. The human audit mitigates this; it does

not eliminate it.

4. **Baseline coverage.** Only Baseline A is specified; B is unavailable and

C lacks the recovery and observation layers SRS §11.3 assumes. The

attribution SRS §11.3 asks for is out of reach.

5. **Metric gaps.** `INCONCLUSIVE` is not an observable category (§4.2),

which limits how precisely "could not tell" can be distinguished from

"failed".

6. **No adversarial coverage.** None of the SRS §12.4 adversarial scenarios

are implementable against the current demo app.

7. **Latency comparability.** Absolute latencies are machine-specific;

only same-machine before/after comparisons are meaningful, and the

measured baseline set (happy path ≈0.12 s) is small relative to

start-up overhead, which must be excluded or disclosed.

- Any reading of a `null` as zero.
- Non-provisional rates: this report is provisional (see audit section).

Disclaimers

> The current test suite is a regression suite, not proof of general
> browser-agent performance.

> These results are measured on one local workflow against one local target
> with a two-parameter fault taxonomy. They do not generalise to other
> websites, workflows, fault models, browsers, or to model-driven agents.

> Baseline A compares fixed-step replay against Chimera's waiting, retry,
> and verification layers. It does not measure workflow learning, recovery,
> or the value of a model.

> No recovery improvement is claimed: no recovery implementation and no
> recovery baseline exist.

Exclusions

- Run `dev-20261028-baseline-a`: 1 warm-up episode(s) excluded from every aggregate (outside any cell, design §14.3).
- Run `dev-20261028-chimera`: 1 warm-up episode(s) excluded from every aggregate (outside any cell, design §14.3).

Limitations

(Evaluation.md §6.1 cites “§7 of this document”; the limitations paragraph lives in §8 at this revision and is reproduced verbatim below.)

1. **Scale.** One workflow, one target, four fault scenarios, three input

variations. Roughly 10–30 episodes per run at the default trial count —

far below SRS §11.2's 100-episode minimum for a meaningful zero-rate

claim.

2. **Fault taxonomy width.** Two parameters. The evaluation split varies

values, not types. No unseen-fault generalisation can be assessed.

3. **Verifier risk.** The independent verifier is itself a component that

can be wrong, in both directions. The human audit mitigates this; it does

not eliminate it.

4. **Baseline coverage.** Only Baseline A is specified; B is unavailable and

C lacks the recovery and observation layers SRS §11.3 assumes. The

attribution SRS §11.3 asks for is out of reach.

5. **Metric gaps.** `INCONCLUSIVE` is not an observable category (§4.2),

which limits how precisely "could not tell" can be distinguished from

"failed".

6. **No adversarial coverage.** None of the SRS §12.4 adversarial scenarios

are implementable against the current demo app.

7. **Latency comparability.** Absolute latencies are machine-specific;

only same-machine before/after comparisons are meaningful, and the

measured baseline set (happy path ≈0.12 s) is small relative to

start-up overhead, which must be excluded or disclosed.

- Rates beyond their stated denominators and bounds.
- Recovery, generalisation, or model claims of any kind.
- Comparisons across benchmark versions (refused at render).
- Any reading of a `null` as zero.

Disclaimers

> The current test suite is a regression suite, not proof of general
>
> browser-agent performance.

> These results are measured on one local workflow against one local target
>
> with a two-parameter fault taxonomy. They do not generalise to other
>
> websites, workflows, fault models, browsers, or to model-driven agents.

> Baseline A compares fixed-step replay against Chimera's waiting, retry,
> and verification layers. It does not measure workflow learning, recovery,
> or the value of a model.

> No recovery improvement is claimed: no recovery implementation and no

Exclusions

- Run eval-20261028-baseline-a: 1 warm-up episode(s) excluded from every aggregate (outside any cell, design §14.3).

- Run `eval-20261028-chimera`: 1 warm-up episode(s) excluded from every aggregate (outside any cell, design §14.3).

Limitations

(Evaluation.md §6.1 cites “§7 of this document”; the limitations paragraph lives in §8 at this revision and is reproduced verbatim below.)

1. **Scale.** One workflow, one target, four fault scenarios, three input

variations. Roughly 10–30 episodes per run at the default trial count —

far below SRS §11.2's 100-episode minimum for a meaningful zero-rate

claim.

2. **Fault taxonomy width.** Two parameters. The evaluation split varies

values, not types. No unseen-fault generalisation can be assessed.

3. **Verifier risk.** The independent verifier is itself a component that

can be wrong, in both directions. The human audit mitigates this; it does

not eliminate it.

4. **Baseline coverage.** Only Baseline A is specified; B is unavailable and

C lacks the recovery and observation layers SRS §11.3 assumes. The

attribution SRS §11.3 asks for is out of reach.

5. **Metric gaps.** `INCONCLUSIVE` is not an observable category (§4.2),

which limits how precisely "could not tell" can be distinguished from

"failed".

6. **No adversarial coverage.** None of the SRS §12.4 adversarial scenarios

are implementable against the current demo app.

7. **Latency comparability.** Absolute latencies are machine-specific;

only same-machine before/after comparisons are meaningful, and the

measured baseline set (happy path ≈0.12 s) is small relative to

start-up overhead, which must be excluded or disclosed.

Disclaimers

> The current test suite is a regression suite, not proof of general
> browser-agent performance.
>
> These results are measured on one local workflow against one local target
> with a two-parameter fault taxonomy. They do not generalise to other
> websites, workflows, fault models, browsers, or to model-driven agents.
>
> Baseline A compares fixed-step replay against Chimera's waiting, retry,
> and verification layers. It does not measure workflow learning, recovery,
> or the value of a model.
>
> No recovery improvement is claimed: no recovery implementation and no
> recovery baseline exist.
